Pilot study area

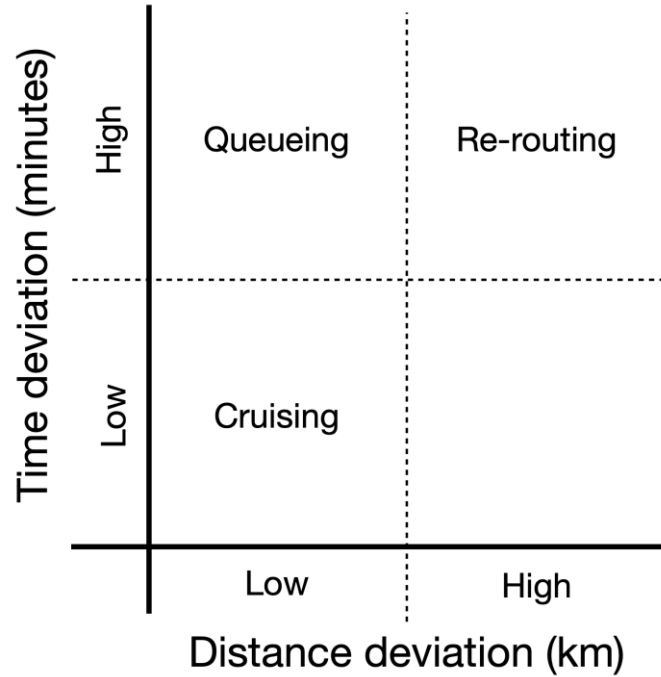

CVLZs are a minority of curb allocations and zones are about 8 meters in length

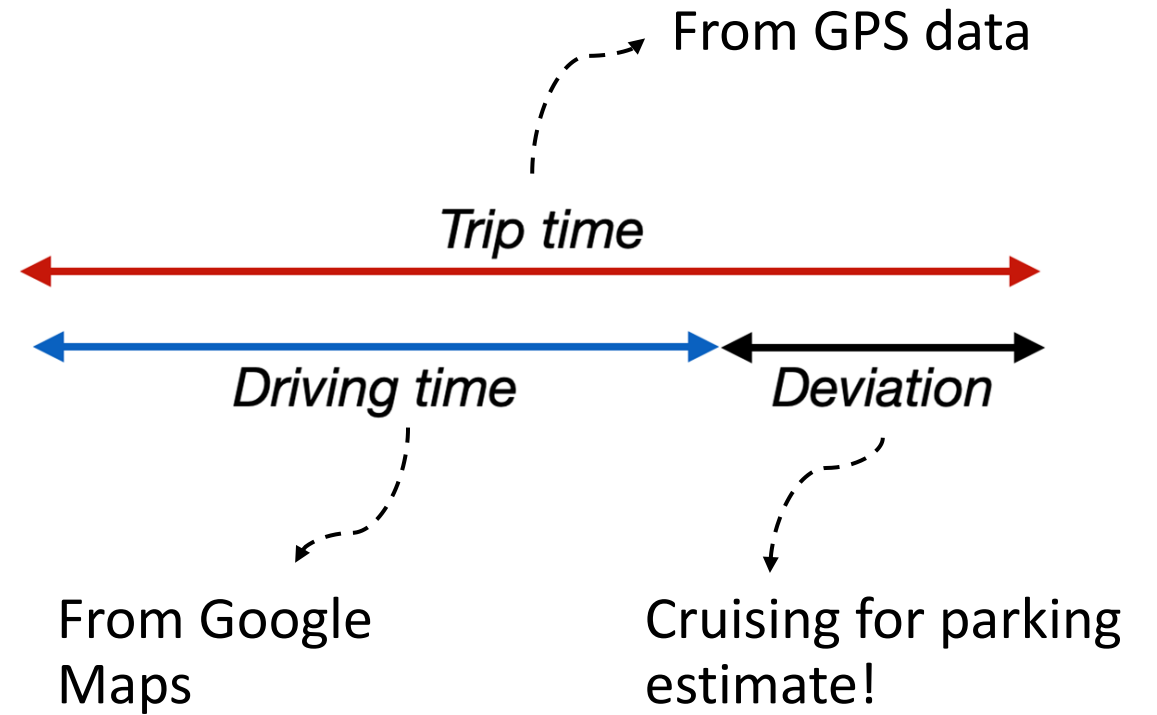

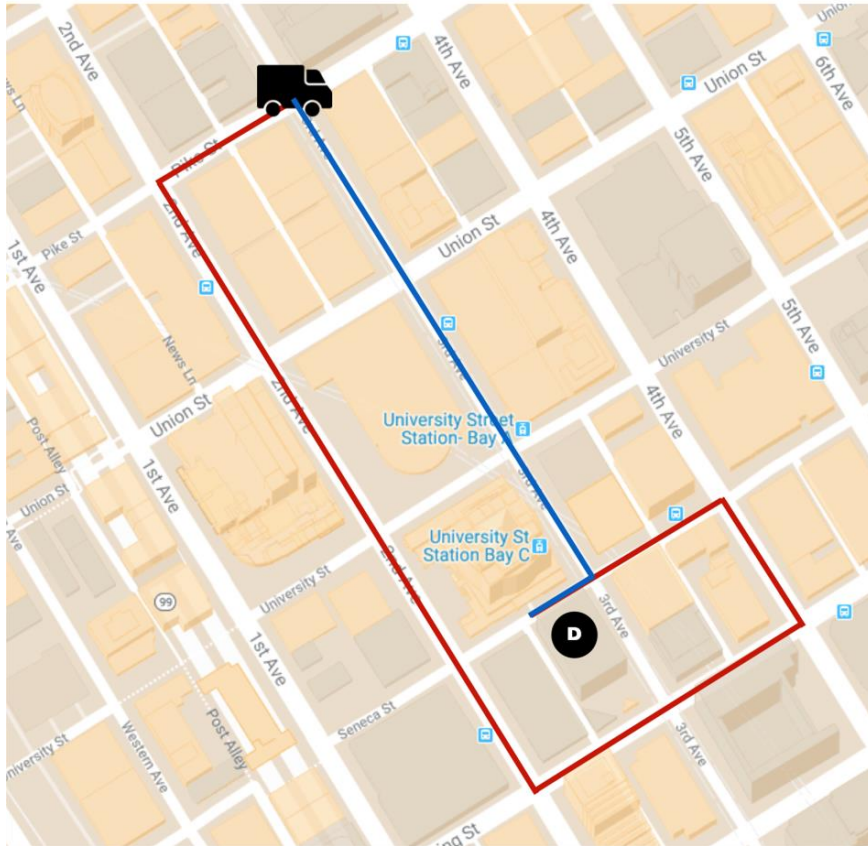

Do commercial vehicles search for parking?

Measuring cruising for parking

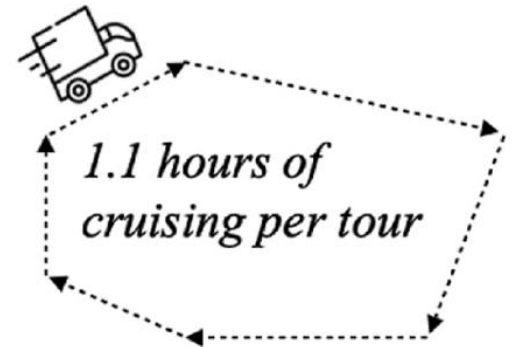

Given a sample of 2,900 trips by a parcel delivery company operating in Seattle, we obtained the following descriptive statistics:

- 1) On average, a commercial vehicle spent **2.3 minutes cruising per trip.**

- 2) Cruising represents **28% of total trip time** on average.

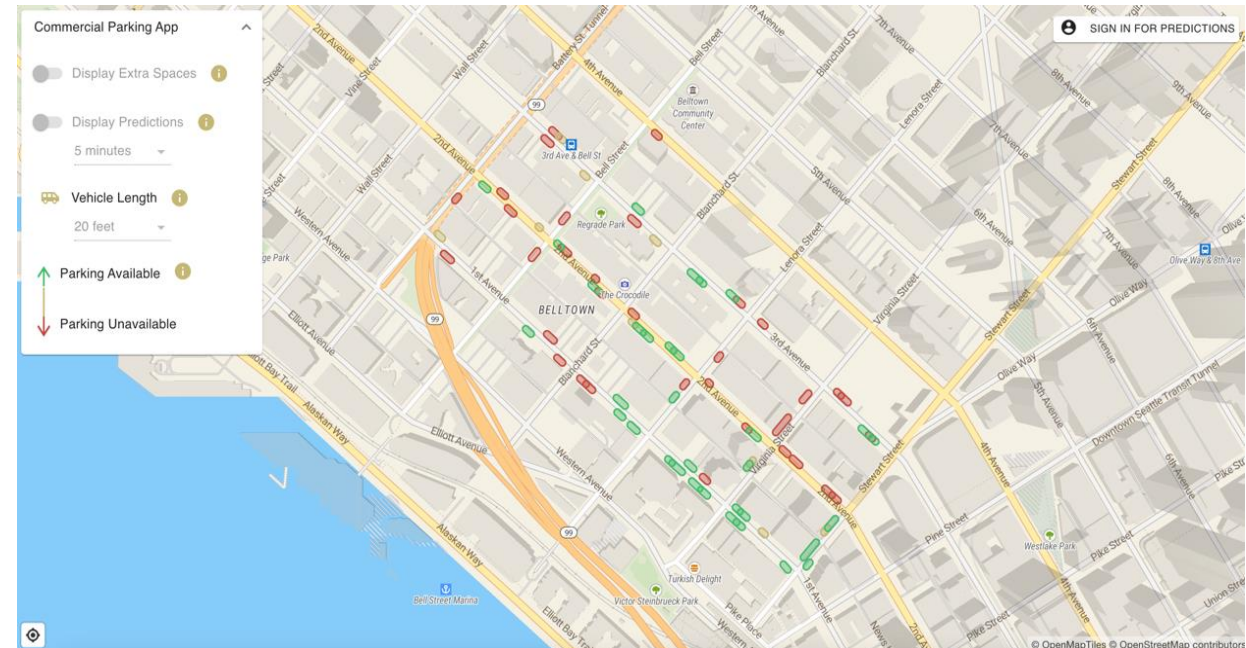

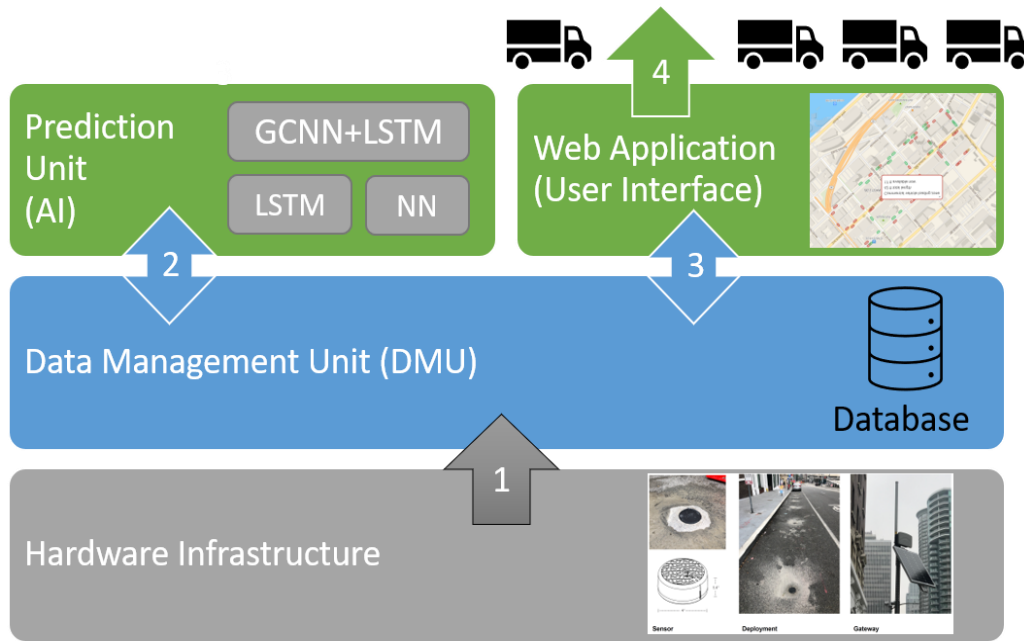

- 3) The total average cruising per tour was **1.1 hours.**

- 4) Cruising times decreased as more curbside was allocated to **commercial vehicles** and **paid parking** and as more **off-street parking areas** were available at a destination, whereas it increased as more curb space was allocated to a **bus zone.**

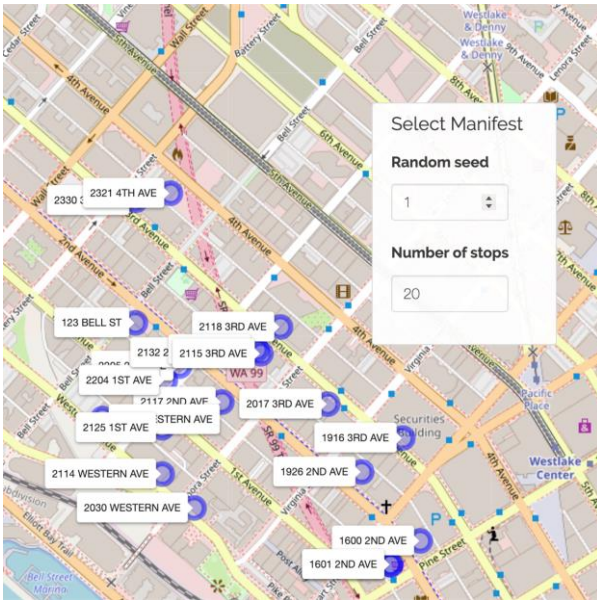

Commercial Vehicle Parking App (Open Park)

- 1 The Data Management Unit (DMU) uses a Restful API to collect the occupancy data from the deployed hardware in near-real time and store in a MariaDB database.
- 2 The Prediction Unit takes historical data from the DMU to develop a data model that can predict at 5-, 15-, and 30-min horizons. DMU stores those predictions into the database.
- 3 The Web API interacts with the DMU to access the historical data and predictions from the database.
- 4 The commercial fleet can use the web application to visualize the data and check availability of the parking spaces for five, fifteen, and thirty-minutes time horizons.

→ Randomized experiment (treatment=app, control=no app.)

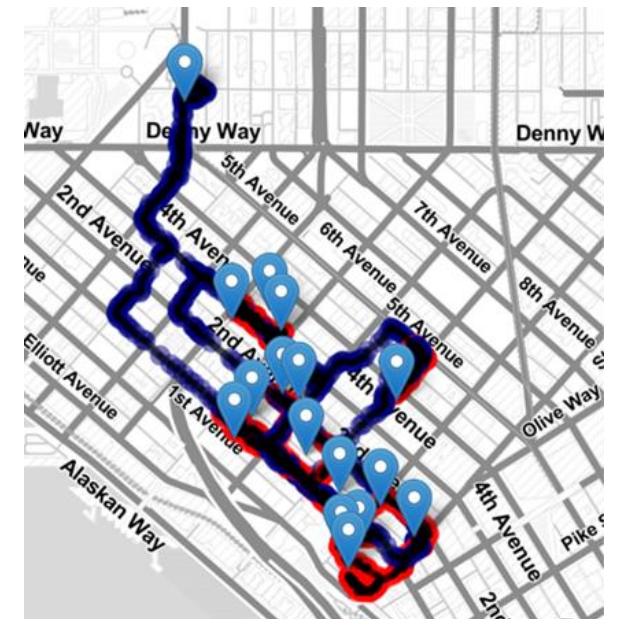

1) Created synthetic delivery manifests

2) Hired drivers to perform deliveries w/o app

3) Data collection & analysis (app vs. no app)

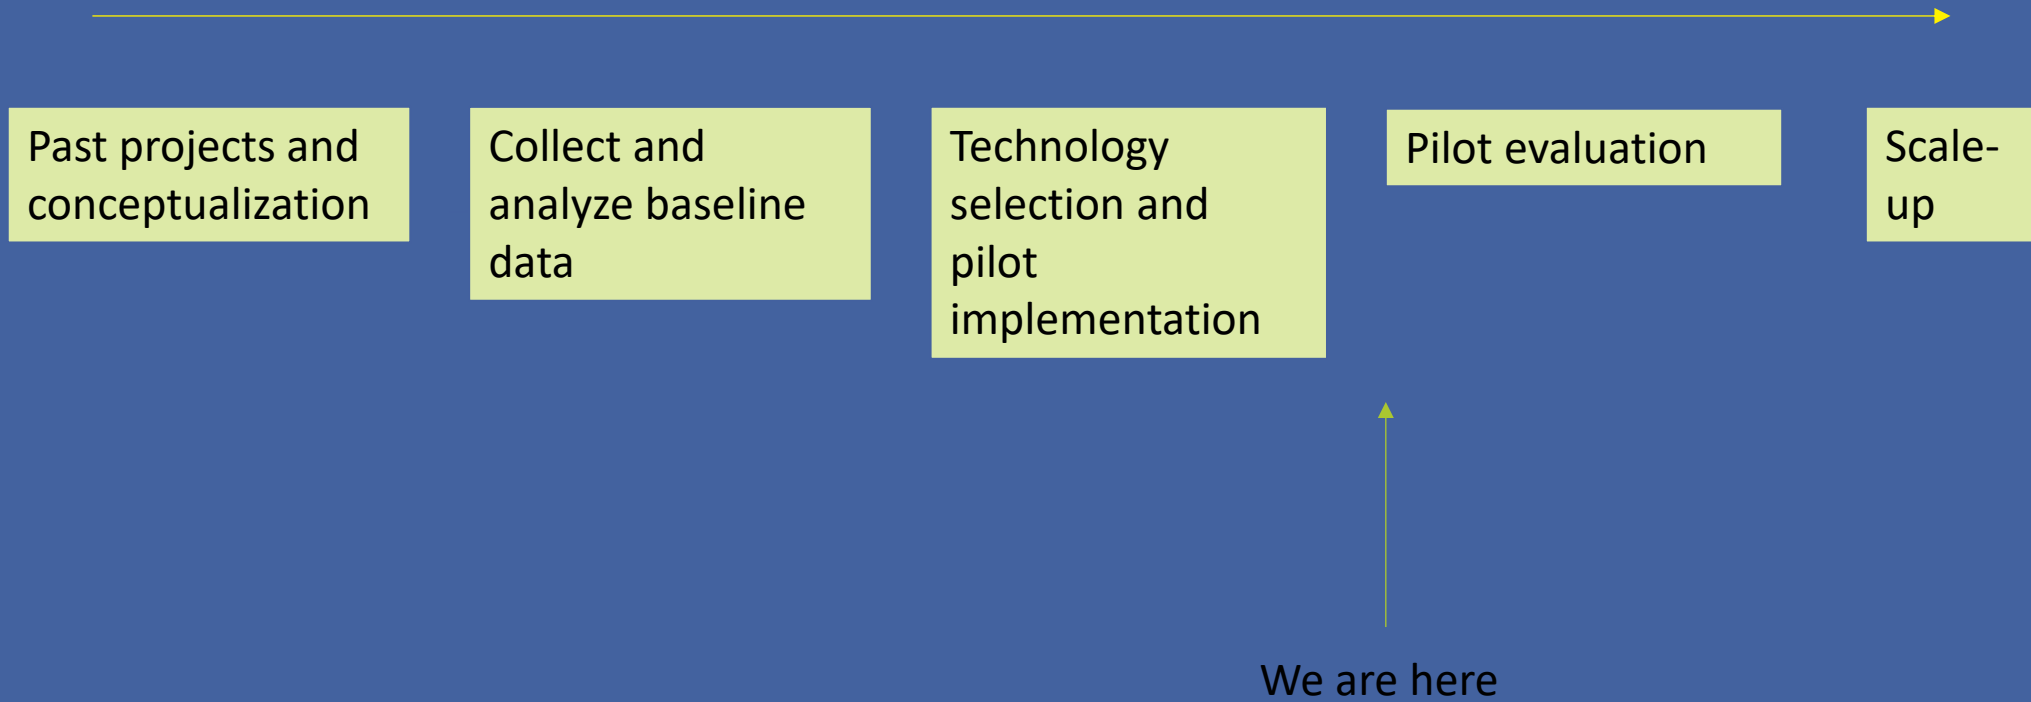

- Estimated four mixed-effect random intercept regression models
 - Each model contained a binary variable $1_{[App]}$ which takes value 1 whenever OpenPark was used
 - The estimated coefficients for $1_{[App]}$ quantify the impact of using OpenPark on the performance metrics

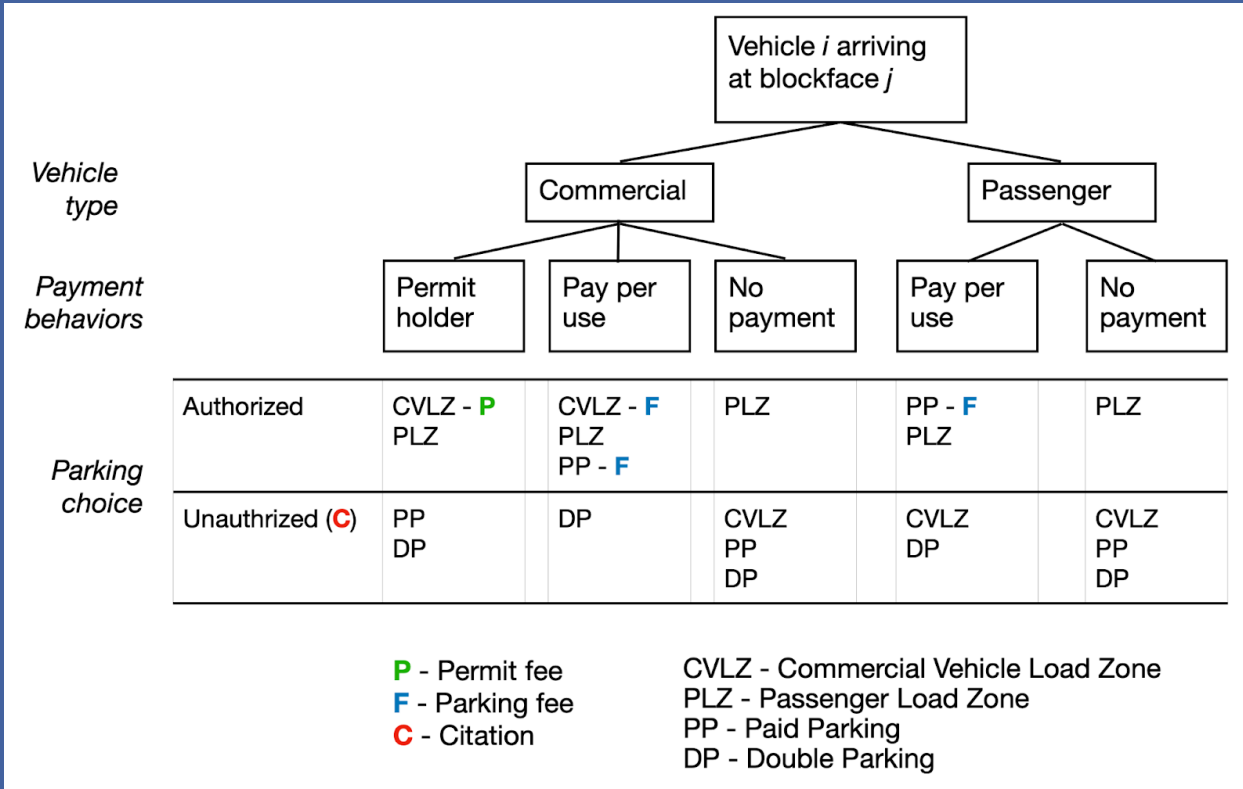

Second Seattle DISCOCURB

SMART Project timeline

Existing pricing mechanisms

Transaction type	No. transactions	Tot. revenue (%)	Revenue per feet of CVLZ
CVLZ - P	Unknown	\$134,040.6 (57.0%) ²	\$34.4
CVLZ - F	13,080	\$11,400.0 (4.8%)	\$2.9
CVLZ - C	1,697	\$89,941.0 (38.2%)	\$23.1
Total	Unknown	\$235,381.6	\$60.4

1. we use 2022 as reference year

2. the total revenue from permit purchases is multiplied by the total share of CVLZs in study area wrt total CVLZ length

- CVLZ - P: Commercial vehicle that carries a valid permit and chooses to park at a CVLZ
- CVLZ - F: Commercial vehicle not carrying a permit that chooses to park at a CVLZ and pay a one-time parking fee
- CVLZ - C: Commercial vehicle not carrying a permit that chooses to park at a CVLZ

Permit purchasing dwindling

Table 7. Permit issued and percentage by primary business activity type (2017-2023)

Primary business activity type	No. issued permits	Percentage issued permits
Wholesale Trade	6488	26.2%
Construction	3925	15.8%
Other Services (except Public Administration)	2951	11.9%
Retail trade	2227	9.0%
Information	1710	6.9%
Manufacturing	1439	5.8%
Admin. Support, Waste Manag. and Remediation Services	1394	5.6%

Current State

80% of users of CVLZ are unauthorized

62% of permit holding CVs comply with regulations

>75% of CVLZ permit holders are “service” vehicles

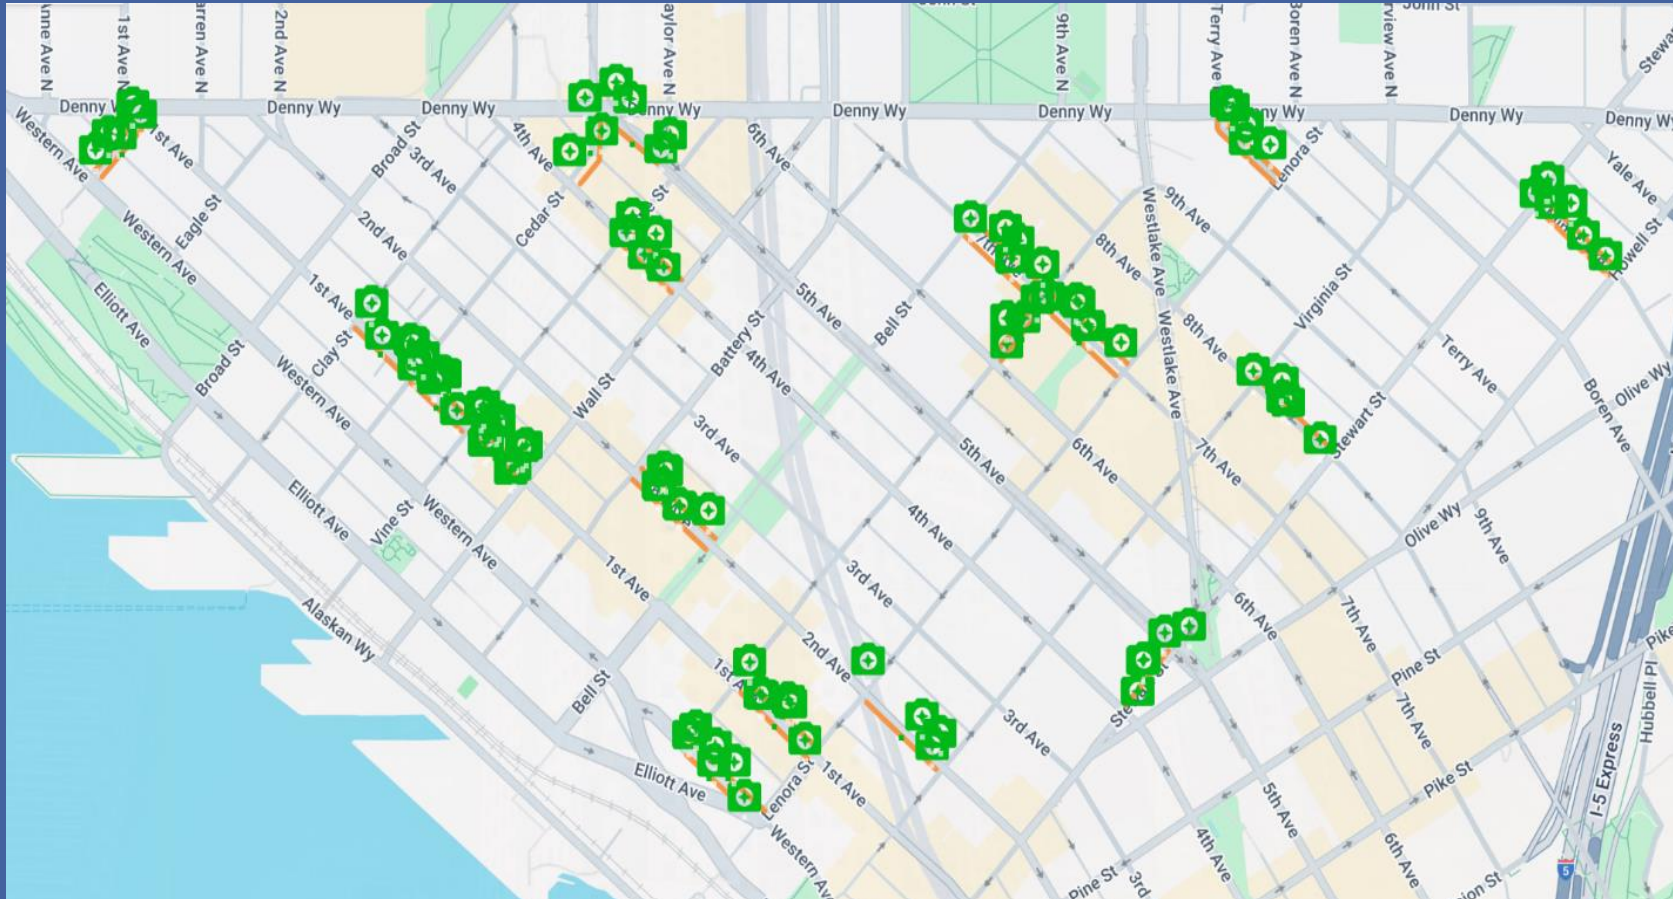

Goal

Increase number of CVLZ permits purchased

Increase automated enforcement of CVLZ use

Installed technology

- **Current method of commercial curbspace management in Seattle is not sufficiently widely used and penalizing good actors**
- **Industry desire for more active management and equality in enforcement**
- **Demonstrated upsides to technology implementation for both city and carriers**
 - Major challenges with technology delivering on expectations and the political appetite for technology implementation
